

SAPTHAGIRI NPS UNIVERSITY

A REPORT ON

Outreach Activity-2 : 24BEORA409

Title: Good Health and Wellbeing

Submitted to the partial fulfillment of the requirements for the Third Semester

Bachelor of Engineering in

Computer Science and Engineering

Submitted By

Section : 4CSE27

CERTIFICATE

(May-June 2026)

This is to certify that the **Outreach Activity-2 (24BEORA409)** has been successfully carried out by the following Punith D, Punith Kumar M , Purushotham K , Prerit R Deyagond, Puttaraj T M, Priyanshu Kumar Mishra, R Teja, Punith C, Prem Yadav **and** Punith Gowda R bonafide students of **Sapthagiri NPS University, Bengaluru**, in partial fulfilment of the requirements for the award of degree of **Computer Science and Engineering, Sapthagiri NPS University, Bengaluru** during **Fourth semester B.E in Computer Science and Engineering** . The Outreach Activity-2 report has been approved as it satisfies the academic requirements in respect of Outreach Activity-2 for the said degree.

DEPARTMENT COMPUTER SCIENCE AND ENGINEERING

DECLARATION

We, the undersigned students of the Department of Computer Science and Engineering, Sapthagiri NPS University, Bengaluru, hereby declare that the Outreach Activity-2 titled “**Good Health and Wellbeing**” was carried out by our team of ten students as a part of the academic outreach program conducted on 8-05-2026.

We affirm that this activity and report are the results of our own effort and have not been copied or reproduced from any other source. The purpose of this outreach was to apply our technical and social knowledge for community benefit and experiential learning.

ACKNOWLEDGEMENT

The joy and satisfaction that accompany the successful completion of any task would be incomplete without the mention of those who made it possible. We are glad to express my gratitude towards my prestigious college Sapthagiri NPS University, Bengaluru for providing me with utmost knowledge, encouragement and the maximum facilities in undertaking this project.

We would like to extend my special thanks to **Director**, Department of Computer Science and Engineering, SNPSU for her support and encouragement.

We am grateful to Outreach Activity-2 coordinator **Dr. P Vanajakshi, Professor**, Dept. of CSE, SNPSU for her encouragement and suggestion, given to us during Outreach Activity-2.

.We are also grateful to all the Cluster Heads, Class Advisors, Cluster wise Coordinators of the Department of Computer Science and Engineering for their encouragement and support.

24SUUBECS1603	Punith C
24SUUBECS1574	Prem Yadav
24SUUBECS1602	Punith Gowda R

ABSTRACT

Ending epidemics such as AIDS, tuberculosis, and malaria is one of the major global health targets under Sustainable Development Goal 3: Good Health and Well-Being. These infectious diseases continue to cause millions of deaths every year and create serious social, economic, and health-related challenges across the world. Developing countries are highly affected due to poverty, lack of awareness, poor sanitation, limited medical facilities, and inadequate access to proper healthcare services. The report examines the causes, spread, impact, and preventive measures related to these epidemics and emphasizes the urgent need for global action to control and eliminate them.

AIDS, caused by the Human Immunodeficiency Virus (HIV), weakens the immune system and makes the body vulnerable to infections and diseases. Lack of awareness, unsafe practices, and limited access to treatment contribute to the spread of HIV/AIDS. Tuberculosis is another dangerous infectious disease that mainly affects the lungs and spreads through the air when infected individuals cough or sneeze. Malaria, caused by parasites transmitted through mosquito bites, remains a major public health issue in tropical and subtropical regions. These diseases not only affect physical health but also reduce productivity, increase healthcare costs, and slow down national development.

The report highlights the importance of preventive healthcare measures such as vaccination, regular medical checkups, early diagnosis, awareness campaigns, improved sanitation, and access to affordable medicines. Government programs, international organizations, healthcare workers, and community participation play an important role in reducing infection rates and providing support to affected individuals. Advancements in medical research, technology, and healthcare infrastructure are also essential for improving disease control and treatment methods.

Furthermore, the report stresses the need for equal healthcare access in rural and economically weaker areas where medical services are often limited. Educating people about hygiene, safe health practices, and disease prevention can significantly reduce the spread of epidemics. Strong healthcare policies, proper funding, and global cooperation are necessary to achieve long-term success in eliminating these diseases.

CHAPTER 1

1. Introduction

Good health is one of the most important requirements for the growth and development of individuals and society. A healthy population contributes to economic progress, social stability, and overall national development. However, many countries around the world still face serious health challenges due to poverty, lack of awareness, poor sanitation, limited healthcare facilities, and the spread of infectious diseases. To address these global health issues, the United Nations introduced Sustainable Development Goal 3 (SDG 3): Good Health and Well-Being, which aims to ensure healthy lives and promote well-being for people of all ages.

One of the major targets of SDG 3 is to end epidemics such as AIDS, tuberculosis, and malaria. These diseases continue to affect millions of people worldwide and remain a major cause of death, especially in developing and underdeveloped countries. AIDS weakens the human immune system and reduces the body's ability to fight infections. Tuberculosis mainly affects the lungs and spreads through the air, while malaria is caused by parasites transmitted through mosquito bites. These diseases not only affect physical health but also create social and economic burdens on families and communities.

The spread of epidemics is often linked to poor healthcare systems, lack of education, unhealthy living conditions, and insufficient access to medical treatment. Many people living in rural and economically weaker areas do not receive timely diagnosis or proper healthcare services. As a result, infectious diseases continue to spread and cause preventable deaths. Therefore, improving healthcare infrastructure, increasing public awareness, and providing affordable treatment are essential steps in controlling these epidemics.

CHAPTER 2

2.1 Overview

Sustainable Development Goal 3 (SDG 3), titled Good Health and Well-Being, focuses on ensuring healthy lives and promoting well-being for people of all ages. Health is a fundamental part of human development, and a strong healthcare system is essential for building a productive and successful society. Despite advancements in medical science and technology, millions of people around the world still suffer from life-threatening diseases, poor healthcare services, malnutrition, and lack of awareness. Therefore, achieving global health targets has become one of the most important priorities for governments and international organizations.

One of the major objectives of SDG 3 is to end epidemics such as AIDS, tuberculosis, and malaria. These diseases continue to affect millions of individuals every year, especially in developing and underdeveloped countries. AIDS weakens the immune system and makes the body vulnerable to infections. Tuberculosis is a contagious disease that mainly affects the lungs, while malaria spreads through infected mosquito bites and causes severe illness and death in many tropical regions. The continued spread of these diseases creates serious challenges for public health, economic growth, and social development.

The overview of this report explains the importance of controlling and eliminating infectious diseases through proper healthcare systems, awareness programs, vaccination, sanitation, and medical treatment. It highlights the role of governments, healthcare workers, international organizations, and communities in reducing the spread of epidemics and improving public health conditions. The report also discusses the importance of early diagnosis, affordable medicines, medical research, and healthcare accessibility for all sections of society.

Governments and international organizations such as the World Health Organization (WHO), United Nations (UN), and various healthcare agencies are working together to fight infectious diseases through vaccination drives, awareness campaigns, healthcare funding, medical research, and improved healthcare infrastructure. Public health policies and global cooperation have helped reduce infection rates in many countries, but continuous efforts are still required to completely eliminate these diseases.

Education and awareness are among the most effective tools in preventing epidemics. People must be educated about personal hygiene, safe health practices, nutrition, sanitation, and the importance of early medical treatment. Rural and underdeveloped areas especially require better healthcare accessibility and awareness programs because lack of information often leads to delayed treatment and rapid disease spread. Providing equal healthcare opportunities to all individuals regardless of economic status is necessary to achieve global health goals.

Technological advancements and medical research also play a significant role in improving disease prevention and treatment. Modern diagnostic tools, vaccines, medicines, and healthcare technologies have helped save millions of lives worldwide. Continuous investment in healthcare innovation and research is important for discovering new treatments and controlling future outbreaks effectively.

Overall, this report provides a detailed overview of the importance of ending epidemics like AIDS, tuberculosis, and malaria under Sustainable Development Goal 3: Good Health and Well-Being. It explains the causes, effects, challenges, and preventive measures related to these diseases while highlighting the role of healthcare systems, government initiatives, awareness programs, and public participation. Achieving this goal requires collective global action, equal healthcare access, and continuous efforts to build a healthier, safer, and more sustainable future for all people.

2.2 Outreach Activity Survey

The Outreach Activity Survey was conducted to collect information and understand public awareness regarding epidemics such as AIDS, tuberculosis, and malaria under Sustainable Development Goal 3: Good Health and Well-Being. The survey aimed to analyze people's knowledge about infectious diseases, preventive healthcare measures, sanitation practices, and the importance of medical treatment and awareness programs. It also helped in identifying the level of understanding among individuals about the causes, symptoms, spread, and prevention of these diseases.

The survey activity involved interaction with different groups of people, including students, local residents, workers, and community members. Questions were asked regarding personal hygiene, healthcare accessibility, vaccination awareness, mosquito control measures, and knowledge about communicable diseases. The responses collected during the survey provided useful insights into the common health-related challenges faced by society and the need for better public awareness programs.

During the outreach activity, it was observed that many individuals had basic knowledge about diseases like AIDS, tuberculosis, and malaria, but several people were still unaware of proper preventive measures and early symptoms. Lack of awareness, poor sanitation, unhealthy living conditions, and limited healthcare access were identified as major factors contributing to the spread of infectious diseases. In rural and economically weaker areas, people often lacked regular medical checkups and proper healthcare facilities, which increased the risk of delayed diagnosis and treatment.

The survey also highlighted the importance of health education and awareness campaigns in improving public understanding of disease prevention. Many participants agreed that educational programs, social campaigns, free medical camps, vaccination drives, and government healthcare initiatives are essential for controlling epidemics .

CHAPTER 3

3.1 Innovative approaches taken

Several innovative approaches were adopted during the outreach activity to increase public awareness and encourage active participation in promoting good health and well-being. The main objective of these approaches was to make health education more interactive, practical, and easily understandable for people from different age groups and social backgrounds.

Traditional awareness methods were combined with modern communication techniques to improve the effectiveness of the campaign and ensure better community engagement.

One of the major innovative approaches taken was the use of interactive awareness sessions and public discussions. Instead of only distributing information, participants were encouraged to actively ask questions and share their experiences related to health issues and infectious diseases. This helped create better understanding and allowed people to learn in a more engaging manner. Real-life examples and simple explanations were used to make complex health topics easier to understand for the public.

Visual presentation methods such as posters, charts, banners, and infographic materials were used to spread awareness about AIDS, tuberculosis, and malaria. These visual tools helped people quickly understand the symptoms, causes, preventive measures, and treatment methods related to infectious diseases. Attractive and informative displays increased public attention and encouraged more people to participate in the activity.

Digital communication platforms and social media awareness were also used as innovative approaches to reach a larger audience. Health-related messages, awareness posters, and educational content were shared through online platforms to spread information quickly and effectively.

3.2 Knowledge and Understanding gained

The outreach activity and survey on Sustainable Development Goal 3: Good Health and Well-Being provided valuable knowledge and understanding about major global health challenges and the importance of preventive healthcare. Through the activity, participants gained a deeper understanding of infectious diseases such as AIDS, tuberculosis, and malaria, including their causes, symptoms, methods of transmission, and preventive measures. The program helped increase awareness about the importance of maintaining good health and adopting safe healthcare practices in daily life.

One of the major learnings gained from the activity was the significance of public awareness in controlling the spread of epidemics. Many people were found to have limited knowledge regarding disease prevention, hygiene, vaccination, and early medical treatment. This highlighted the need for continuous health education and awareness campaigns, especially in rural and economically weaker communities. Participants understood that lack of awareness and misinformation can lead to delayed treatment and increased health risks.

The activity also improved understanding about the importance of personal hygiene and sanitation in preventing infectious diseases. Participants learned about the role of clean surroundings, safe drinking water, proper waste disposal, mosquito control, and healthy lifestyle habits in reducing the spread of illnesses. Practical demonstrations and discussions helped people understand how small preventive actions can significantly improve public health conditions.

The outreach activity also increased awareness regarding the social impact of diseases such as HIV/AIDS. Participants understood the harmful effects of stigma, discrimination, and social isolation faced by infected individuals. The discussions encouraged empathy, support, and responsible behavior toward affected people, promoting a more inclusive and understanding society.

3.3 Best practices incorporated

Several best practices were incorporated during the outreach activity to ensure effective communication, better public participation, and successful awareness generation regarding Sustainable Development Goal 3: Good Health and Well-Being. These practices helped improve the quality of the activity and increased the overall impact of the health awareness campaign within the community.

One of the most important best practices incorporated was the use of simple and understandable communication methods. Health-related information about diseases such as AIDS, tuberculosis, and malaria was explained in clear and easy language so that people from different educational backgrounds could understand the message effectively. Technical medical terms were simplified to ensure better public understanding and participation.

Active community engagement was another key practice followed during the outreach activity. Participants were encouraged to ask questions, share opinions, and discuss their health-related concerns openly. This interactive approach created a comfortable learning environment and helped improve awareness about preventive healthcare measures and healthy lifestyle habits.

Visual learning methods such as posters, charts, banners, and awareness materials were effectively used to make the campaign more informative and attractive. Visual representations helped participants quickly understand important concepts related to disease prevention, hygiene, sanitation, vaccination, and healthcare practices. These methods increased attention and made health education more effective for the public.

The outreach activity also incorporated survey-based learning and data collection practices. Conducting surveys helped identify the level of awareness among people and understand common health challenges faced by the community.

3.4 Challenges and continuous improvement

During the outreach activity on Sustainable Development Goal 3: Good Health and Well-Being, several challenges were faced while conducting surveys, spreading awareness, and interacting with the public. These challenges provided valuable learning experiences and highlighted the importance of continuous improvement in organizing effective health awareness programs and community outreach activities.

One of the major challenges faced during the activity was the lack of awareness and understanding among people regarding infectious diseases such as AIDS, tuberculosis, and malaria. Many individuals had limited knowledge about the causes, symptoms, methods of transmission, and preventive measures related to these diseases. Some participants also believed in myths and misconceptions regarding healthcare and disease prevention, which created difficulties in spreading accurate information.

Another significant challenge was limited public participation in certain areas. Some individuals were hesitant to interact or discuss health-related topics openly due to fear, stigma, or lack of interest. In particular, discussions related to HIV/AIDS were difficult because social stigma and misinformation still exist in many communities. Convincing people to actively participate in awareness sessions and surveys required patience, communication skills, and continuous engagement.

Language barriers and differences in educational backgrounds also created communication difficulties during the outreach activity. Explaining medical and health-related concepts to people with limited education required the use of simple language, visual aids, and practical examples. This highlighted the importance of designing awareness programs that are easy to understand and accessible to all sections of society.

CHAPTER 4

Documentation of Activities

The documentation of activities carried out during the outreach program on Sustainable Development Goal 3: Good Health and Well-Being was an essential part of the project. Proper documentation helped in recording the planning, execution, participation, observations, and outcomes of the awareness campaign and survey activities. It also provided a structured record of the efforts taken to spread awareness about infectious diseases such as AIDS, tuberculosis, and malaria and the importance of preventive healthcare practices.

The outreach activity began with proper planning and preparation. The team identified the objectives of the program, selected the target audience, prepared survey questions, and collected awareness materials such as posters, charts, banners, and informational content. Responsibilities were divided among team members to ensure smooth coordination and effective management of the activity.

During the awareness campaign, interactions were conducted with students, local residents, workers, and community members to educate them about the causes, symptoms, prevention, and treatment of infectious diseases. Information regarding hygiene, sanitation, vaccination, mosquito control, regular health checkups, and healthy lifestyle habits was shared with the public. Participants were encouraged to ask questions and actively engage in discussions related to public health and disease prevention.

The survey activity was documented by recording public responses, observations, and feedback collected from participants. The survey helped identify the level of awareness among people and highlighted major healthcare challenges faced within the community. Data related to healthcare accessibility, sanitation conditions, awareness levels, and preventive healthcare practices was collected and analyzed.

CHAPTER 5

Geotag Photographs

Conclusion

The outreach activity conducted under Sustainable Development Goal 3: Good Health and Well-Being was successful in spreading awareness about infectious diseases such as AIDS, tuberculosis, and malaria and promoting the importance of preventive healthcare practices. The program provided valuable opportunities to interact with the community, understand public health challenges, and educate people about maintaining good health, hygiene, and sanitation. Through surveys, awareness sessions, discussions, and community interaction, participants gained better understanding about the causes, symptoms, prevention, and treatment of major infectious diseases. The activity highlighted the importance of early diagnosis, vaccination, regular medical checkups, mosquito control, and healthy lifestyle practices in reducing the spread of epidemics and improving public health conditions.

The outreach activity also revealed several challenges such as lack of awareness, social stigma, poor sanitation, limited healthcare accessibility, and misinformation among people. These challenges emphasized the need for continuous health education, stronger healthcare systems, and regular awareness campaigns, especially in rural and economically weaker communities. The program demonstrated that proper communication, community participation, and public support are essential for creating positive health outcomes.

Various innovative approaches and best practices incorporated during the activity helped improve public engagement and made the awareness campaign more effective. Visual presentations, interactive discussions, practical demonstrations, and survey-based learning encouraged active participation and enhanced public understanding of healthcare issues. The activity also promoted social responsibility, teamwork, leadership skills, and empathy toward individuals affected by infectious diseases.

Overall, the outreach program contributed significantly toward promoting awareness about good health and well-being while supporting the objectives of Sustainable Development Goal 3. It emphasized that achieving a healthier society requires collective efforts from governments, healthcare organizations, educational institutions, and individuals.
